1. Motivation & Objective

The Civil Engineering (CE) sector is undergoing a rapid digital transformation driven by Artificial Intelligence (AI). However, the adoption landscape is fragmented. Our objective was to demystify this integration by analyzing real-world data.

Identify which CE domains are successfully adopting AI.

Determine the specific AI technologies driving this change.

Provide a data-driven roadmap for future research and investment.

2. Methodology

We built a custom automated pipeline to aggregate, process, and visualize global trends in CE and AI.

Step 1: Data Collection

We aggregated 744 articles from diverse sources including Google News, RSS feeds, and academic repositories to ensure a comprehensive dataset.

Step 2: AI-Powered Classification

We utilized Google Gemini Pro (LLM) to intelligently analyze each article. The model extracted key metadata: Primary CE Area, specific AI Technologies, and Sentiment Scores.

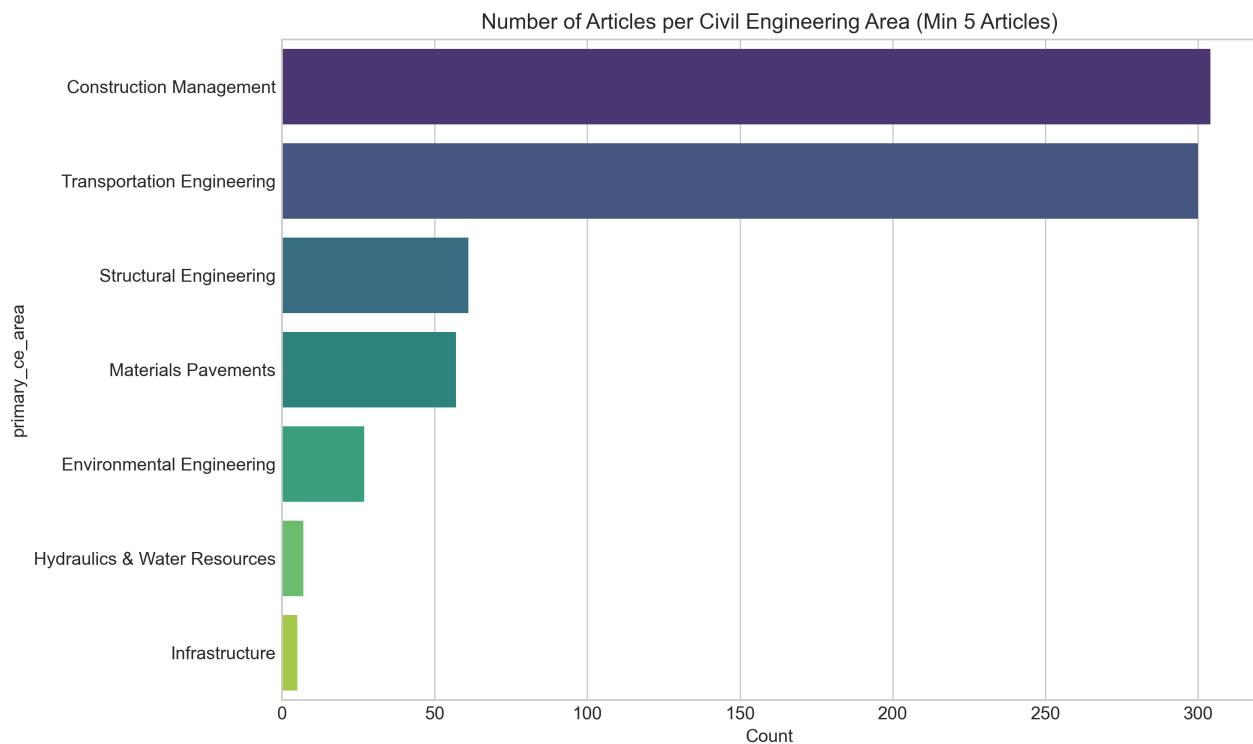

Step 3: Strategic Visualization

Using Python libraries (Pandas, Plotly, NetworkX), we generated advanced visualizations to highlight correlations and clusters.

3. Key Findings (Bulgular)

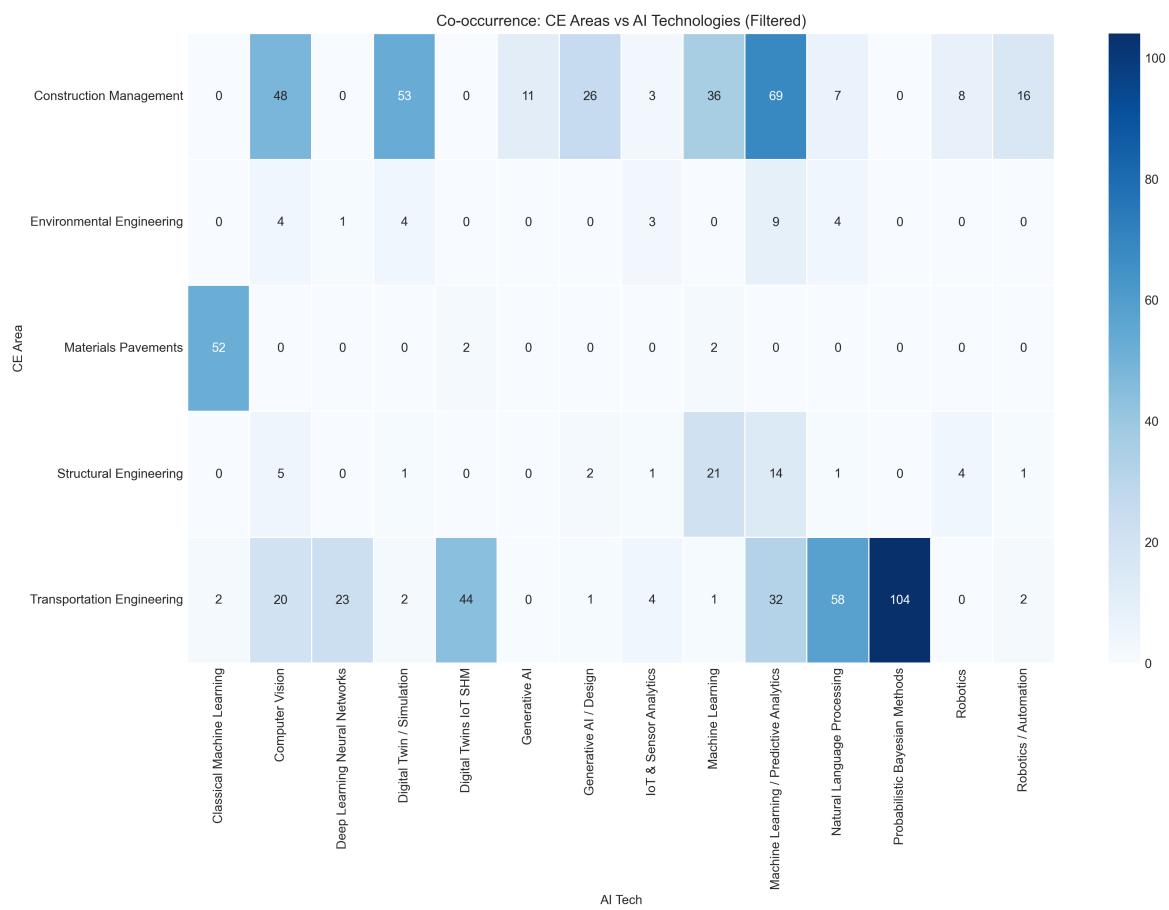

Finding 1: Construction Management Leads Adoption

Our analysis reveals that Construction Management is the most active area for AI integration. It accounts for the highest volume of diverse AI applications, focusing on schedule optimization and safety monitoring.

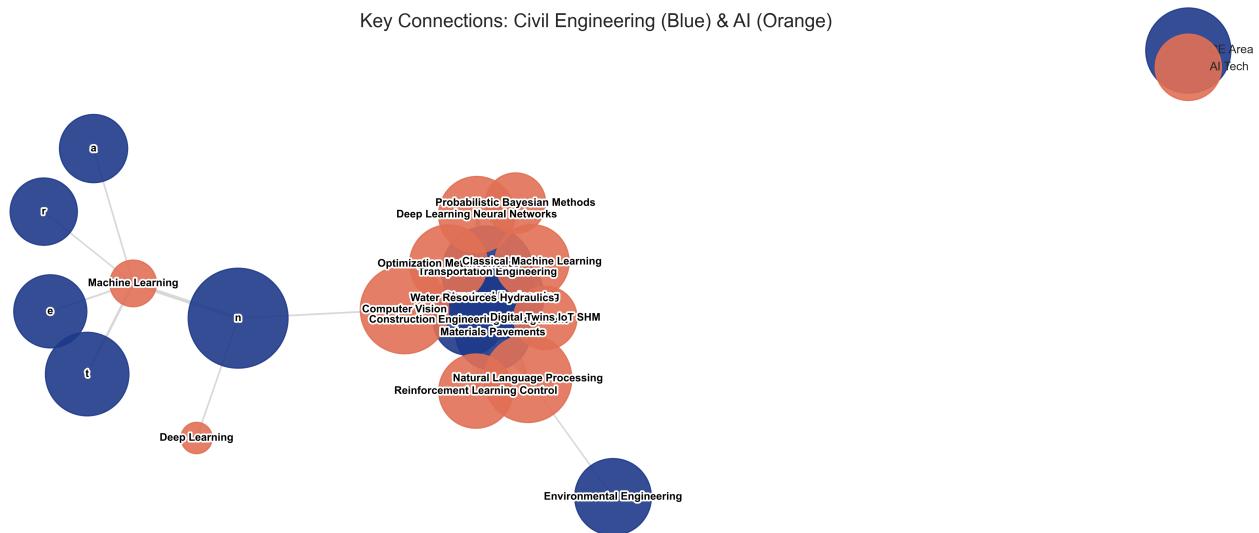

Finding 2: Computer Vision is the Dominant Tech

The heatmap below demonstrates a strong clustering of Computer Vision applications within Construction Management and Structural Engineering (specifically for defect detection). This indicates a shift towards visual data processing.

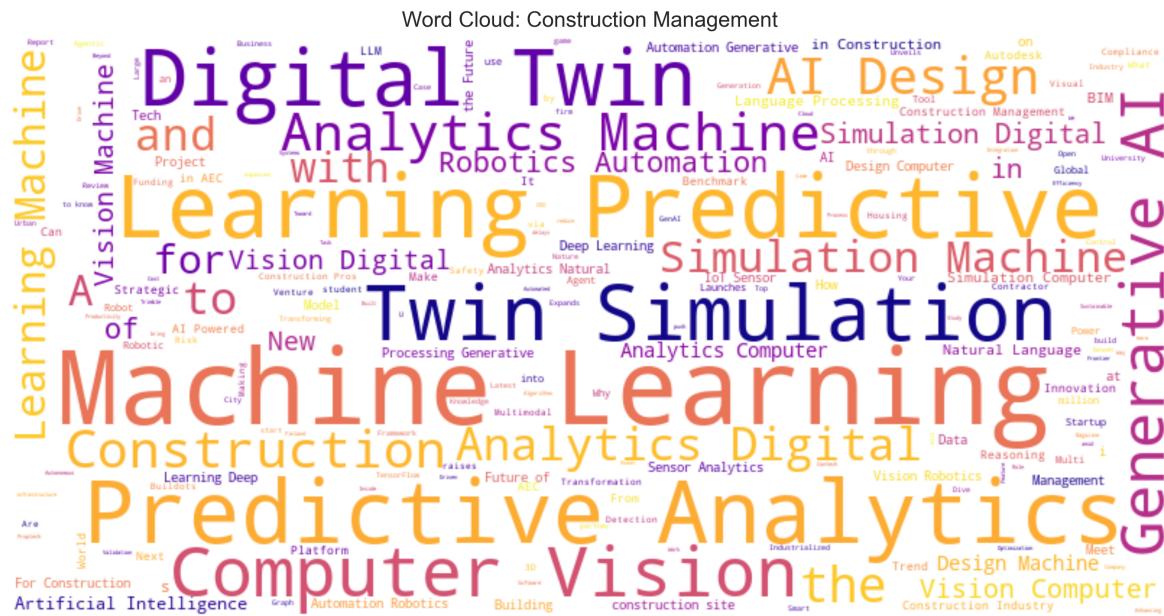

Finding 3: Interdisciplinary Hubs

The Network Graph exposes the 'connective tissue' of the industry. We observe that Machine Learning acts as a central hub connecting almost all CE disciplines, while specialized techs like Robotics are more isolated to specific tasks.

Finding 4: Thematic Focus Areas

Word cloud analysis highlights practical implementation keywords. For Construction Management, terms like 'Safety', 'Monitoring', and 'Optimization' are prevalent.

4. Conclusion

This study confirms that AI is no longer just a theoretical concept in Civil Engineering but an active driver of efficiency and safety. The dominance of Construction Management and Computer Vision suggests that the immediate value of AI is currently found in monitoring and optimizing physical processes. Future opportunities lie in expanding these technologies to Geotechnical and Environmental challenges.
